

New Autism Center to Offer Insurance Coverage and Full Diagnostic Testing

By: Samantha Gray
Autism Spectrum Disorders Clinic

An autism diagnosis is devastating - and now there is hope!

Many will tell you that the cause for autism is due to generalized "genetics." Worse, they'll imply there is no cure or, at least no protocol that can provide families with hope. I can tell you from firsthand experience that these things are simply not true. My son, Zack, was once labeled autistic. To meet him today, you would never know that he once had almost every symptom of autism, especially when you see his mischievous grin and hear his six-year-old giggle.

Once he was diagnosed, conventional medical doctors couldn't help Zack. Consumed with the feeling that what my son was experiencing wasn't normal, healthy or permanent, I did the only thing I could think to do: read. And research. I learned that autism doesn't just occur in one form. "Autism Spectrum Disorders," (ASD) is the umbrella term for neurobiological afflictions that manifest as autism, and there are three frequently occurring disorders. I also learned it's more likely to affect boys than girls.

My head was spinning with the amount of information available on autism. Yet, for

all that was written, defined causes were elusive, there was much that was contradictory and hope for a full recovery was nearly non-existent. To further educate myself and to make contacts with others in the world of autism, I attended my first autism conference in 2007 called Autism One.

At the conference, I found a common denominator between most of the speakers. Testing needed to be done before starting any treatment. Yet no one had ever offered this to my son. It seems as if, once an autism diagnosis is made, the traditional medical community throws up its hands and says, "Sorry, nothing we can do."

It was also during this conference that I met a genetic researcher, epidemiologist and scientist, who has done extensive research and testing on Autism Spectrum Disorders. His time and devotion laid the groundwork for his most ambitious work yet – identifying suspected causes of and new treatments for ASD. Meeting him changed my and Zack's lives.

When we returned home, Zack went through the various testing procedures I now knew were available. These included complete blood and urine workups that measure things such as, heavy metal toxicity, vitamin deficiency, oxidative

stress, adrenal abnormalities, hormonal imbalances and much more. By taking the guesswork out of the diagnosis, a medical path to wellness is revealed.

The information their testing provided uncovered treatment options not previously considered or suggested. These findings, along with other lifestyle and diet modifications contributed to bringing Zack back to health. Remembering what Zack was like in the throes of his autism, and seeing him as he is now seems to be nothing short of a miracle.

After witnessing Zack's incredible recovery, I decided to open the Autism Spectrum Disorder Clinic to get these treatments to as many families as possi-

ble. We'll have medical professionals to provide the proper procedures and protocols necessary to do medical testing and diagnoses.

The best part? Our diagnostic procedures and treatments are covered by insurance. Since we'll be able to offer insurance coverage for the testing and treatments, the stress of managing the extreme financial hardship typically seen by families dealing with autism is considerably reduced.

Contact us today at (636)922-4472 to learn more about these revolutionary treatments. You truly have nothing to lose and your child has everything to gain – what are you waiting for?
